2.4 A Case Study: Percolation
2.4 A Case Study: Percolation

OUR GOAL IS TO WRITE BUG-FREE SOFTWARE. I’LL PAY A TEN-DOLLAR BONUS FOR EVERY BUG YOU FIND AND FIX.

YAHOO! WE'RE RICH! YES!!! YES!!!

I HOPE THIS DRIVES THE RIGHT BEHAVIOR.

I'M GONNA WRITE ME A NEW MINIVAN THIS AFTERNOON!
A Case Study: Percolation

**Percolation.** Pour liquid on top of some porous material. Will liquid reach the bottom?

**Applications.** [chemistry, materials science, ...]
- Chromatography.
- Spread of forest fires.
- Natural gas through semi-porous rock.
- Flow of electricity through network of resistors.
- Permeation of gas in coal mine through a gas mask filter.
- ...

A Case Study: Percolation

Percolation. Pour liquid on top of some porous material. Will liquid reach the bottom?

Abstract model.
- $N$-by-$N$ grid of sites.
- Each site is either blocked or open.

![Percolation Grids](image-url)
A Case Study: Percolation

**Percolation.** Pour liquid on top of some porous material. Will liquid reach the bottom?

**Abstract model.**
- \(N\)-by-\(N\) grid of sites.
- Each site is either **blocked** or **open**.
- An open site is **full** if it is connected to the top via open sites.

![Diagram of percolation](image.png)
A Scientific Question

Random percolation. Given an N-by-N system where each site is vacant with probability $p$, what is the probability that system percolates?

Remark. Famous open question in statistical physics.

Recourse. Take a computational approach: Monte Carlo simulation.
Data representation. Use one $N$-by-$N$ boolean matrix to store which sites are open; use another to compute which sites are full.

Standard array I/O library. Library to support reading and printing 1- and 2-dimensional arrays.

```
8 8
0 0 1 1 1 0 0 0
1 0 0 1 1 1 1 1
1 1 1 0 0 1 1 0
0 0 1 1 0 1 1 1
0 1 1 1 0 1 1 0
0 1 0 0 0 0 1 1
1 0 1 0 1 1 1 1
1 1 1 1 0 1 0 0
```

shorthand: 0 for blocked, 1 for open

```
open[][]
```
Data representation. Use one $N$-by-$N$ boolean matrix to store which sites are open; use another to compute which sites are full.

Standard array I/O library. Library to support reading and printing 1- and 2-dimensional arrays.

**Full site**

```
8 8
0 0 1 1 1 0 0 0
0 0 0 1 1 1 1 1
0 0 0 0 0 1 1 0
0 0 0 0 0 1 1 1
0 0 0 0 0 1 1 0
0 0 0 0 0 0 1 1
0 0 0 0 1 1 1 1
0 0 0 0 0 1 0 0
```

shorthand: 0 for not full, 1 for full
public class StdArrayIO {

    // read M-by-N boolean matrix from standard input
    public static boolean[][] readBoolean2D() {
        int M = StdIn.readInt();
        int N = StdIn.readInt();
        boolean[][] a = new boolean[M][N];
        for (int i = 0; i < M; i++)
            for (int j = 0; j < N; j++)
            if (StdIn.readInt() != 0) a[i][j] = true;
        return a;
    }

    // print boolean matrix to standard output
    public static void print(boolean[][] a) {
        for (int i = 0; i < a.length; i++) {
            for (int j = 0; j < a[i].length; j++)
            if (a[i][j]) StdOut.print("1 ");
            else StdOut.print("0 ");
            StdOut.println();
        }
    }
}
**Scaffolding**

**Approach.** Write the easy code first. Fill in details later.

```java
public class Percolation {
    // return boolean matrix representing full sites
    public static boolean[][] flow(boolean[][] open) {
    }

    // does the system percolate?
    public static boolean percolates(boolean[][] open) {
        int N = open.length;
        boolean[][] full = flow(open);
        for (int j = 0; j < N; j++)
            if (full[N-1][j]) return true;
        return false; // system percolates if any full site in bottom row
    }

    // test client
    public static void main(String[] args) {
        boolean[][] open = StdArrayIO.readBoolean2D();
        StdArrayIO.print(flow(open));
        StdOut.println(percolates(open));
    }
}
```
Vertical Percolation
Vertical Percolation

**Next step.** Start by solving an easier version of the problem.

**Vertical percolation.** Is there a path of open sites from the top to the bottom that goes *straight down*?

---

**Vertically percolates**

- Site connected to top with a vertical path

**Does not vertically percolate**

- No open site connected to top with a vertical path
Vertical Percolation

**Q.** How to determine if site \((i,j)\) is full?

**A.** It's full if \((i,j)\) is open and \((i-1,j)\) is full.

**Algorithm.** Scan rows from top to bottom.
Vertical Percolation

Q. How to determine if site \((i,j)\) is full?
A. It's full if \((i,j)\) is open and \((i-1,j)\) is full.

Algorithm. Scan rows from top to bottom.

```java
public static boolean[][] flow(boolean[][] open) {
    int N = open.length;
    boolean[][] full = new boolean[N][N];
    for (int j = 0; j < N; j++)
        full[0][j] = open[0][j];

    for (int i = 1; i < N; i++)
        for (int j = 0; j < N; j++)
            full[i][j] = open[i][j] && full[i-1][j];

    return full;
}
```
Vertical Percolation: Testing

Testing. Use standard input and output to test small inputs.

% more testT.txt
5
0 1 1 0 1
0 0 1 1 1
1 1 0 1 1
1 0 0 0 1
0 1 1 1 1

% java VerticalPercolation < testT.txt
5
0 1 1 0 1
0 0 1 1 1
0 0 1 0 1
0 0 0 0 1
0 0 0 0 1
true

% more testF.txt
5
1 0 1 0 0
1 0 1 1 1
1 1 1 0 1
1 0 0 0 1
0 0 0 1 1

% java VerticalPercolation < testF.txt
5
1 0 1 0 0
1 0 1 0 0
1 0 1 0 0
1 0 0 0 0
0 0 0 0 0
false
Vertical Percolation: Testing

Testing. Add helper methods to generate random inputs and visualize using standard draw.

```java
public class Percolation {
    ...

    // return a random N-by-N matrix; each cell true with prob p
    public static boolean[][] random(int N, double p) {
        boolean[][] a = new boolean[N][N];
        for (int i = 0; i < N; i++)
            for (int j = 0; j < N; j++)
                a[i][j] = StdRandom.bernoulli(p);
        return a;
    }

    // plot matrix to standard drawing
    public static void show(boolean[][] a, boolean foreground)
    }
```
Data Visualization

Visualization. Use standard drawing to visualize larger inputs.

```java
class Visualize {
    public static void main(String[] args) {
        int N = Integer.parseInt(args[0]);
        double p = Double.parseDouble(args[1]);
        boolean[][] open = Percolation.random(N, p);
        boolean[][] full = Percolation.flow(open);
        StdDraw.setPenColor(StdDraw.BLACK);
        Percolation.show(open, false);
        StdDraw.setPenColor(StdDraw.CYAN);
        Percolation.show(full, true);
    }
}
```

% java Visualize 20 .95 1       % java Visualize 20 .9 1
Vertical Percolation: Probability Estimate

Analysis. Given $N$ and $p$, run simulation $T$ times and report average.

```java
public class Estimate {
    public static double eval(int N, double p, int T) {
        int cnt = 0;
        for (int t = 0; t < T; t++) {
            boolean[][] open = Percolation.random(N, p);
            if (VerticalPercolation.percolates(open)) cnt++;
        }
        return (double) cnt / M;
    }

    public static void main(String[] args) {
        int N = Integer.parseInt(args[0]);
        double p = Double.parseDouble(args[1]);
        int T = Integer.parseInt(args[2]);
        StdOut.println(eval(N, p, T));
    }
}
```
Vertical Percolation: Probability Estimate

**Analysis.** Given $N$ and $p$, run simulation $T$ times and report average.

```
% java Estimate 20 .7 100000
0.015768

% java Estimate 20 .8 100000
0.206757

% java Estimate 20 .9 100000
0.925191

% java Estimate 40 .9 100000
0.448536
```

agrees with theory $1 - (1 - p^N)^N$

takes about 1 minute

takes about 4 minutes

a lot of computation!

**Running time.** Proportional to $TN^2$.

**Memory consumption.** Proportional to $N^2$. 
General Percolation
General Percolation: Recursive Solution

**Percolation.** Given an $N$-by-$N$ system, is there any path of open sites from the top to the bottom, not just straight down.

**Depth first search.** To visit all sites reachable from i-j:
- If i-j already marked as reachable, return.
- If i-j not open, return.
- Mark i-j as reachable.
- Visit the 4 neighbors of i-j recursively.

**Percolation solution.**
- Run DFS from each site on top row.
- Check if any site in bottom row is marked as reachable.
public static boolean[][] flow(boolean[][] open) {
    int N = open.length;
    boolean[][] full = new boolean[N][N];
    for (int j = 0; j < N; j++)
        if (open[0][j]) flow(open, full, 0, j);
    return full;
}

public static void flow(boolean[][] open, boolean[][] full, int i, int j) {
    int N = full.length;
    if (i < 0 || i >= N || j < 0 || j >= N) return;
    if (!open[i][j]) return;
    if (full[i][j]) return;

    full[i][j] = true; // mark
    flow(open, full, i+1, j); // down
    flow(open, full, i, j+1); // right
    flow(open, full, i, j-1); // left
    flow(open, full, i-1, j); // up
}
General Percolation: Probability Estimate

**Analysis.** Given $N$ and $p$, run simulation $T$ times and report average.

```
% java Estimate 20 .5 100000
0.050953

% java Estimate 20 .6 100000
0.568869

% java Estimate 20 .7 100000
0.980804

% java Estimate 40 .6 100000
0.595995
```

**Running time.** Still proportional to $TN^2$.

**Memory consumption.** Still proportional to $N^2$. 

Adaptive Plot
In Silico Experiment

Plot results. Plot the probability that an $N$-by-$N$ system percolates as a function of the site vacancy probability $p$.

Design decisions.
- How many values of $p$?
- For which values of $p$?
- How many experiments for each value of $p$?

![Graphs with labels: too few points, too many points, judicious choice of points]
Adaptive plot. To plot $f(x)$ in the interval $[x_0, x_1]$:

- Stop if interval is sufficiently small.
- Divide interval in half and compute $f(x_m)$.
- Stop if $f(x_m)$ is close to $\frac{1}{2} (f(x_0) + f(x_1))$.
- Recursively plot $f(x)$ in the interval $[x_0, x_m]$.
- Plot the point $(x_m, f(x_m))$.
- Recursively plot $f(x)$ in the interval $[x_m, x_1]$.

Net effect. Short program that judiciously chooses values of $p$ to produce a "good" looking curve without excessive computation.
public class PercolationPlot {
    public static void curve(int N, double x0, double y0, double x1, double y1) {
        double gap = 0.05;
        double error = 0.005;
        int T = 10000;

        double xm = (x0 + x1) / 2;
        double ym = (y0 + y1) / 2;
        double fxm = Estimate.eval(N, xm, T);

        if (x1 - x0 < gap && Math.abs(ym - fxm) < error) {
            StdDraw.line(x0, y0, x1, y1);
            return;
        }

        curve(N, x0, y0, xm, fxm);
        StdDraw.filledCircle(xm, fxm, .005);
        curve(N, xm, fxm, x1, y1);
    }

    public static void main(String[] args) {
        int N = Integer.parseInt(args[0]);
        curve(N, 0.0, 0.0, 1.0, 1.0);
    }
}
Adaptive Plot

**Plot results.** Plot the probability that an \( N \)-by-\( N \) system percolates as a function of the site vacancy probability \( p \).

![Graphs showing percolation probability vs. site vacancy probability](image)

**Phase transition.** If \( p < 0.593 \), system almost never percolates; if \( p > 0.593 \), system almost always percolates.
